Executive Security Summary

Calculated risk posture based on automated analysis.

RANK: HIGH (100/100)

RISK METRICS

CRITICAL	HIGH	MEDIUM	LOW
1	9	2	2

INFO	ATTACK SURFACE	DURATION
0	1 ENDPOINTS	47.24s SCANNED

TECHNICAL FINDINGS & EXPLOIT PROOF

Medium **undefined** A00:2021-General Security

Description: The parse_str function in (1) PHP, (2) Hardened-PHP, and (3) Suhosin, when called without a second parameter, might allow remote attackers to overwrite arbitrary variables by specifying variable names and values in the string to be parsed. NOTE: it is not clear whether this is a design limitation of the function or a bug in PHP, although it is likely to be regarded as a bug in Hardened-PHP and Suhosin.

Source: `Vulnerability Scanner`

High **undefined** A00:2021-General Security

Description: Buffer overflow in the radius_get_vendor_attr function in the Radius extension before 1.2.7 for PHP allows remote attackers to cause a denial of service (crash) and possibly execute arbitrary code via a large Vendor Specific Attributes (VSA) length value.

Source: `Vulnerability Scanner`

Critical **undefined** A00:2021-General Security

Description: A command inject vulnerability allows an attacker to perform command injection on Windows applications that indirectly depend on the CreateProcess function when the specific conditions are satisfied.

Source: `Vulnerability Scanner`

Medium **undefined** A00:2021-General Security

Description: In PHP versions:8.1.* before 8.1.33, 8.2.* before 8.2.29, 8.3.* before 8.3.23, 8.4.* before 8.4.10 when parsing XML data in SOAP extensions, overly large (>2Gb) XML namespace prefix may lead to null pointer dereference. This may lead to crashes and affect the availability of the target server.

Source: `Vulnerability Scanner`

Low undefined

A00:2021-General Security

Description: In PHP versions:8.1.* before 8.1.33, 8.2.* before 8.2.29, 8.3.* before 8.3.23, 8.4.* before 8.4.10 some functions like fsockopen() lack validation that the hostname supplied does not contain null characters. This may lead to other functions like parse_url() treat the hostname in different way, thus opening way to security problems if the user code implements access checks before access using such functions.

Source: `Vulnerability Scanner`

Low Unsafe HTML Assignment (innerHTML)

A00:2021-General Security

Description: The script assigns content to innerHTML. If this content is not properly sanitized, it can execute scripts embedded in the HTML.

Source: `Script: inline-script`

Recommendation: Use element.textContent for plain text or use a trusted sanitization library (like DOMPurify) before using innerHTML.

High SSRF Vulnerability

A10:2021-Server-Side Request Forgery

Description: No description provided.
